First Record of the White-eyed Vireo in Panamá.—A specimen identified by Alexander Wetmore as *Vireo griseus noveboracensis* was taken in a mist net by the author on 16 October 1964 at Almirante, province of Bocas del Toro, on the Caribbean slope of extreme northwestern Panamá. It was the only White-eyed Vireo seen during 40 days of mist-netting in this area from 22 September through 31 October 1964. Sex was not determined. The skin was prepared by Rodolfo Hinds of the Gorgas Memorial Laboratory, and is now deposited in the United States National Museum.

This northern race of the White-eyed Vireo has been recorded as wintering from the southern United States to Guatemala, northern Honduras, Swan Island, and western Cuba, according to the A.O.U. Check-list of North American Birds (1957). This specimen was taken more than 400 miles south of the southern limits of the known winter range. Whether it represents a casual wanderer or a true winter range extension remains to be determined by further collecting.

The generous support of Eugene Odum (NIH HE 08294-02 MET) and Horace Loftin (PHS AI 06072), and encouragement and criticism from Eugene Eisenmann are gratefully acknowledged. —DAVID L. HICKS, *Department of Zoology, University of Georgia, Athens, Georgia, 22 April 1966.*
